

# Controls on Lake Formation on Ice Shelves (COOLFISH) Rebecca Dell, Ian Willis, Neil Arnold

Image modified from  
NASA Earth Observatory  
(Lauren Dauphin)

# Motivation

## WP 1

Develop a continent-wide dataset of surface meltwater extent on ice shelves (1980's-present day)

- Do this using classification algorithms in Google Earth Engine
  - Ultimately want to classify two classes: Ponded Water and Slush

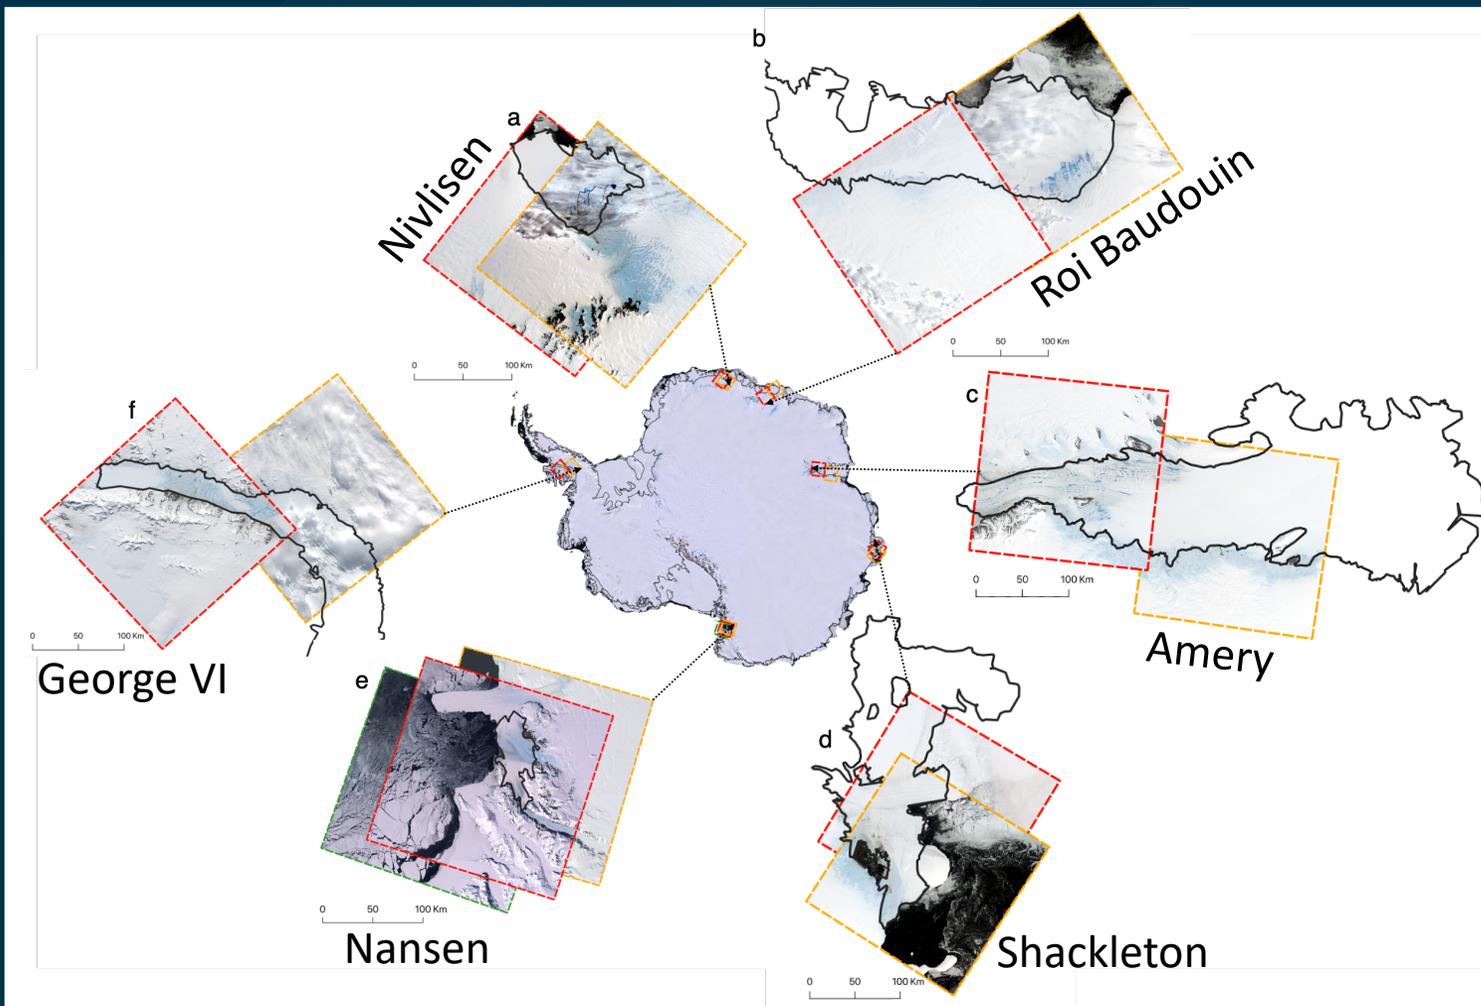

## WP 2

Analyse the observations made in WP 1 with gridded CCI ECVs to:

- Investigate the relationship between surface meltwater on ice shelves and local and regional climate
- Develop predictive models to predict the occurrence of surface meltwater in the future from 21<sup>st</sup> century GCM ensemble outputs.

# WP 1: Selecting Training Sites

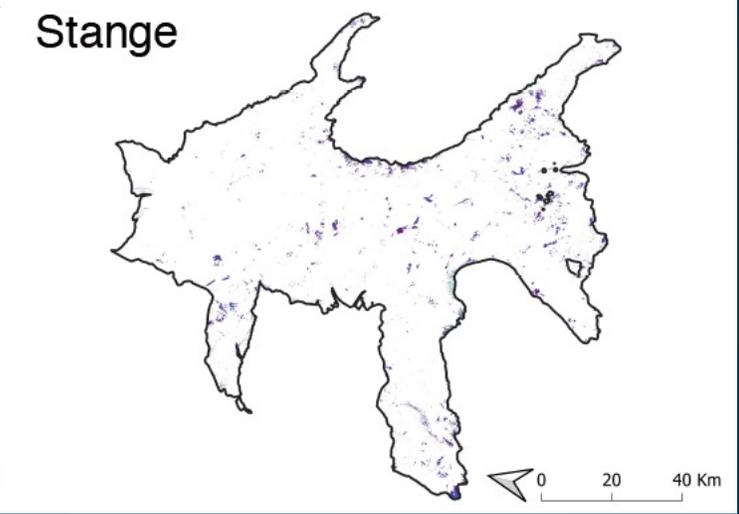

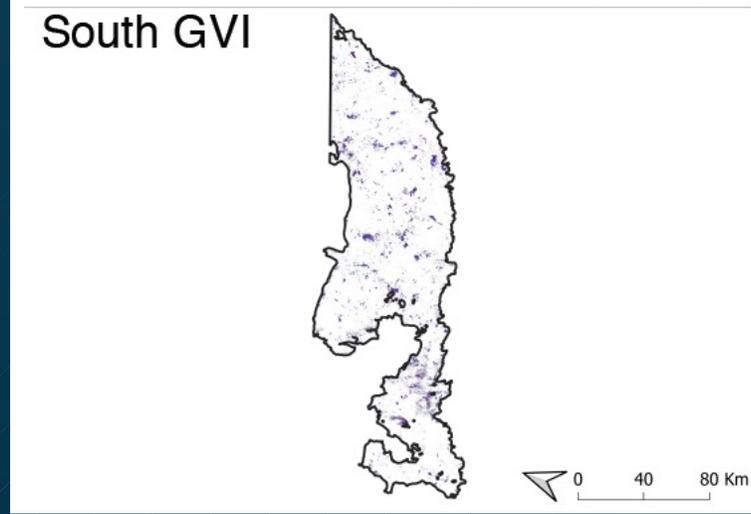

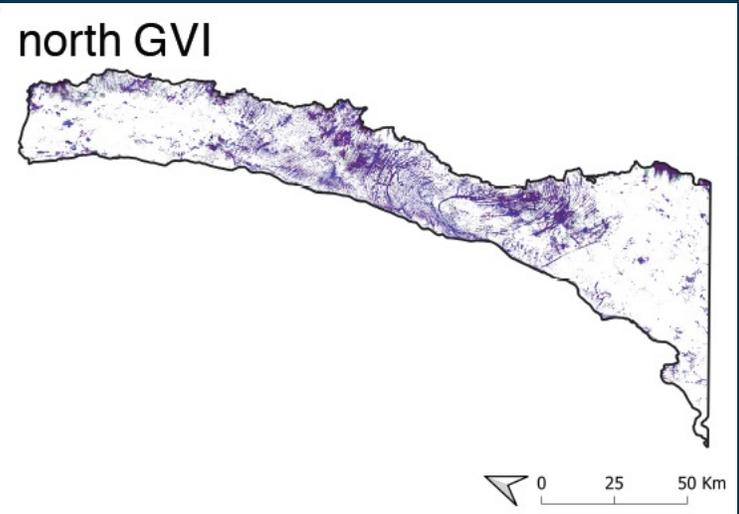

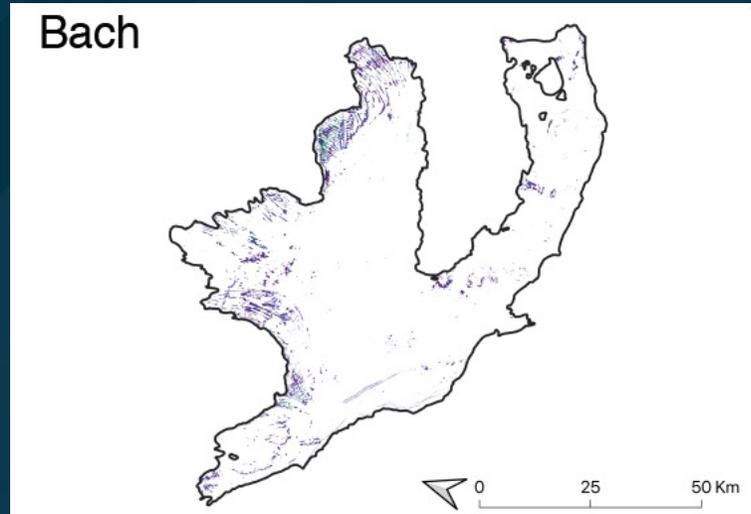

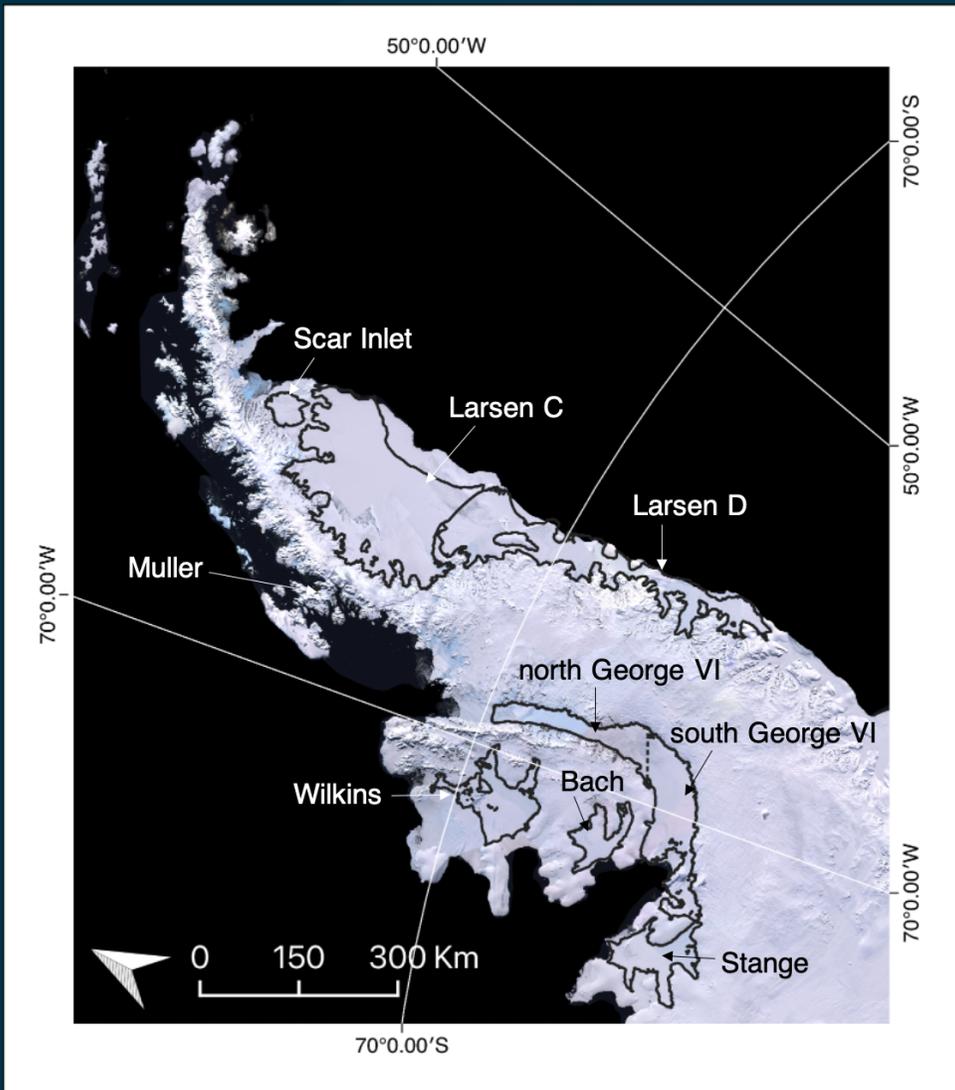

- For each satellite – select suitable training sites and training images.
- The same training sites will be used for each satellite
- Training images have a mix of spectral properties, and are taken from a wide range of dates throughout the melt seasons.
